**CLINICAL REVIEW**

*Controversies in cardiovascular medicine*

## Association is not causation: treatment effects cannot be estimated from observational data in heart failure

**Christopher J. Rush, Ross T. Campbell, Pardeep S. Jhund, Mark C. Petrie, and John J.V. McMurray\***

British Heart Foundation Cardiovascular Research Centre, Institute of Cardiovascular and Medical Sciences, University of Glasgow, 126 University Place, Glasgow G12 8TA, UK

Received 16 January 2018; revised 1 April 2018; editorial decision 22 June 2018; accepted 27 June 2018; online publish-ahead-of-print 1 August 2018

### **Aims**

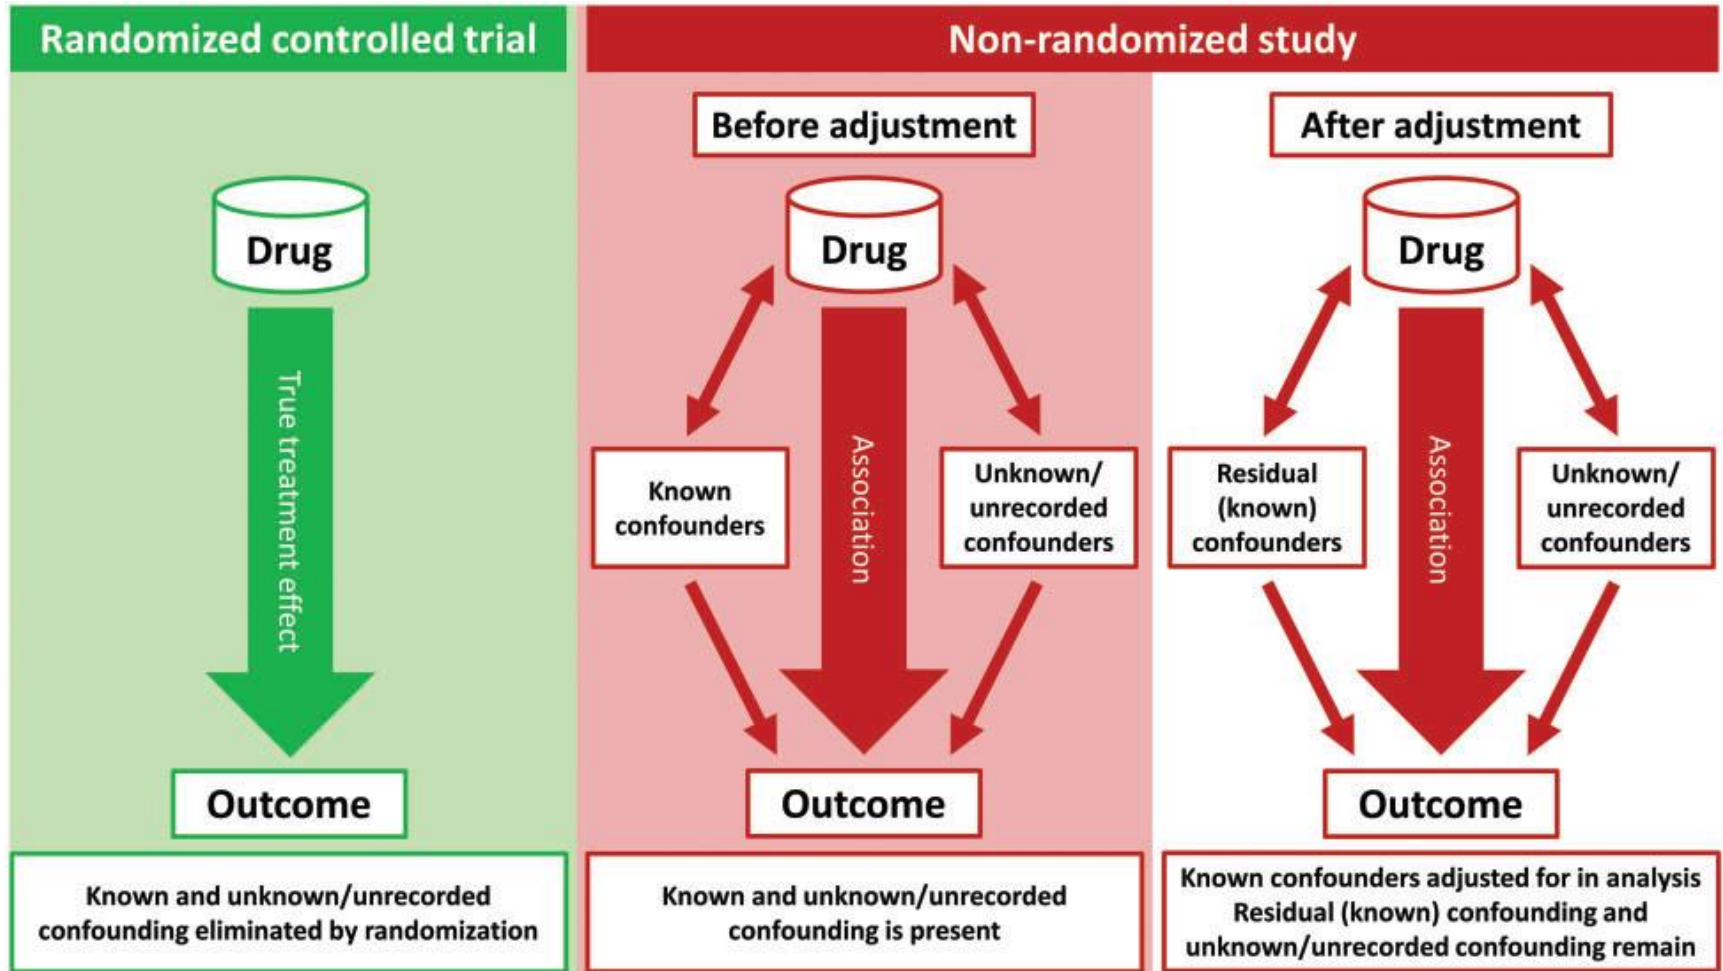

Treatment 'effects' are often inferred from non-randomized and observational studies. These studies have inherent biases and limitations, which may make therapeutic inferences based on their results unreliable. We compared the conflicting findings of these studies to those of prospective randomized controlled trials (RCTs) in relation to pharmacological treatments for heart failure (HF).

### **Methods and results**

We searched Medline and Embase to identify studies of the association between non-randomized drug therapy and all-cause mortality in patients with HF until 31 December 2017. The treatments of interest were: angiotensin-

# Residual study bias

Rush et al., 2018

# Published observational study results

# Trouble with observational research

- Individual studies are often biased due to **confounding, selection bias, and measurement error**
- Across studies, observational research as a whole is even more biased due to **publication bias** and **p-hacking**

# Improving methods to address confounding

- Construct large generic set of covariates
  - $10,000 < n < 100,000$
- Use regularized regression to fit propensity model
- Match or stratify on propensity score

*International Journal of Epidemiology*, 2018, 1–10  
doi: 10.1093/ije/dyy120

Edited by Victoria Stodden, University of Illinois at Urbana-Champaign, Champaign, IL, and accepted by Editorial Board Member Susan T. Fiske October 26, 2017 (received for review June 15, 2017)

Observational healthcare data, such as electronic health records and administrative claims, offer potential to estimate effects of medical products at scale. Observational studies have often been found to be nonreproducible, however, generating conflicting results even when using the same database to answer the same question. One source of discrepancy is error, both ran-

age treatment effect. Systematic error can manifest from multiple sources, including confounding, selection bias, and measurement error. While there is widespread awareness of the potential for systematic error in observational studies and a large body of research that examines how to diagnose and statistically adjust for specific sources of bias, there has been comparatively little

Supplementary data for 'Improving reproducibility using high-throughput observational studies with empirical calibration'

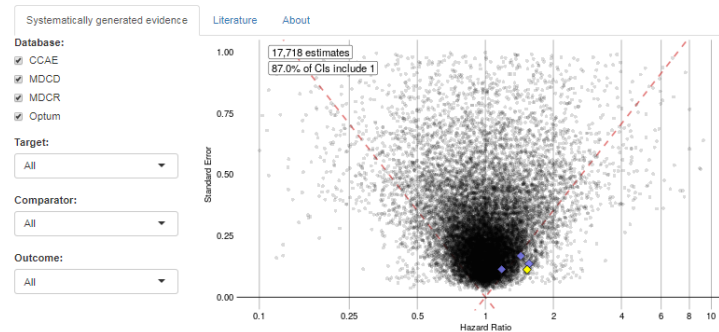

Figure S1. Systematically generated evidence from observational data. Each dot represents a calibrated hazard ratio and confidence interval for a comparison of two depression treatments with respect to an outcome of interest in one of the four databases. Use the controls on the left to filter the result set. After selecting an estimate, details will be shown below.

Details for Mirtazapine vs. duloxetine for Insomnia (MDCR)

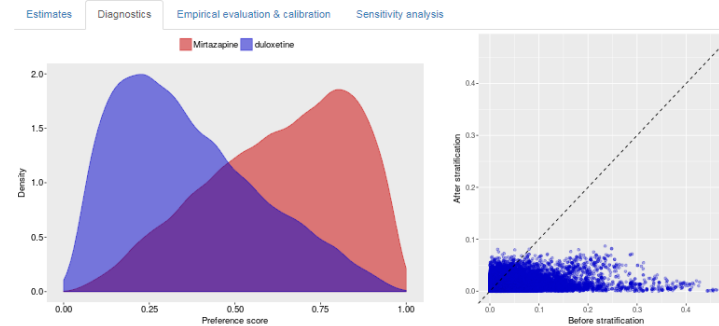

Figure S1.2. Preference score distribution. The preference score is a transformation of the propensity score that adjusts for differences in the sizes of the two treatment groups. A higher overlap indicates subjects in the two groups were more similar in terms of their predicted probability of receiving one treatment over the other.

Figure S1.3. Covariate balance before and after stratification. Each dot represents the standardized difference in means for a single covariate before and after stratification on the propensity score. Move the mouse arrow over a dot for more details.

# LEGEND

LARGE-SCALE EVIDENCE GENERATION AND EVALUATION IN A NETWORK OF DATABASES

# Building the process to generate the evidence

# LEGEND Guiding Principles

1. Evidence will be generated at **large-scale**.
2. **Dissemination** of the evidence will not depend on the estimated effects.
3. Evidence will be generated by consistently applying a **systematic approach** across all research questions.
4. The evidence will be generated using a **pre-specified** analysis design.
5. The evidence will be generated using **open source** software that is freely available to all.
6. The evidence generation process will be **empirically evaluated** by including control research questions where the true effect size is known.
7. The evidence will be generated using **best-practices**.
8. LEGEND will **not** be used to **evaluate methods**.
9. The evidence will be **updated** on a regular basis.
10. **No patient-level data** will be shared between sites in the network, only aggregated data.

| Coronary heart disease           | Hyponatremia                                | Vomiting                     |
| Cough                            | Hypotension                                 |                              |
| Decreased libido                 | Impotence                                   |                              |

# Each research question requires

- Evaluation of the propensity score distribution
- Evaluation of covariate balance
- Inclusion of negative and positive controls
- Empirical calibration

# 76 negative controls

Abnormal cervical smear	Disproportion of reconstructed breast	Nicotine dependence
Abnormal pupil	Effects of hunger	Noise effects on inner ear
Abrasion and/or friction burn of trunk without infection	Endometriosis	Nonspecific tuberculin test reaction
Absence of breast	Epidermoid cyst	Non-toxic multinodular goiter
Absent kidney	Feces contents abnormal	Onychomycosis due to dermatophyte
Acid reflux	Foreign body in orifice	Opioid abuse
Acquired hallux valgus	Ganglion cyst	Passing flatus
Acquired keratoderma	Genetic predisposition	Postviral fatigue syndrome
Acquired trigger finger	Hammer toe	Presbyopia
Acute conjunctivitis	Hereditary thrombophilia	Problem related to lifestyle
Amputated foot	Herpes zoster without complication	Psychalgia
Anal and rectal polyp	High risk sexual behavior	Ptotic breast
Burn of forearm	Homocystinuria	Regular astigmatism
Calcaneal spur	Human papilloma virus infection	Senile hyperkeratosis
Cannabis abuse	Ileostomy present	Somatic dysfunction of lumbar region
Cervical somatic dysfunction	Impacted cerumen	Splinter of face, without major open wound
Changes in skin texture	Impingement syndrome of shoulder region	Sprain of ankle
Chondromalacia of patella	Ingrowing nail	Strain of rotator cuff capsule
Cocaine abuse	Injury of knee	Tear film insufficiency
Colostomy present	Irregular periods	Tobacco dependence syndrome
Complication due to Crohn's disease	Kwashiorkor	Vaginitis and vulvovaginitis
Contact dermatitis	Late effect of contusion	Verruca vulgaris
Contusion of knee	Late effect of motor vehicle accident	Wrist joint pain
Crohn's disease	Leukorrhea	Wristdrop
Derangement of knee	Macular drusen	
Difficulty sleeping	Melena	

# 76 negative controls

# Methods

Evidence generation

This run:

- Emulate target trial: new-user cohort design
- Expert-crafted outcome definitions
- Large scale propensity models
- Stratification + variable ratio matching
- Empirical calibration

Not static. Driven by **defined best practices**, driven by **empirical evaluation**

# Databases

Previously: 4 US insurance databases

Evidence generation

This run:

- US insurance databases
  - IBM® MarketScan® CCAE
  - IBM® MarketScan® MDCCD
  - IBM® MarketScan® MDCCR
  - Optum® Clinformatics®
- Japanese insurance database
  - Japan Medical Data Center
- Korean national insurance database
  - NHIS-NSC
- US EHR databases
  - Columbia University Medical Center
  - Optum® PANTHER®
- German EHR database
  - QuintilesIMS Disease Analyzer (DA) Germany

# Concluding remarks

- Grave concerns exist over published observational research results, due to study bias, publication bias, and p-hacking
- Large-scale observational studies allow for
  - Empirical evaluation and calibration
  - Unbiased dissemination
  - Providing a more complete evidence base
- LEGEND applies this to real world problems
  - Depression
  - Hypertension
