

# Trends in RWD/RWE and Data Standardization

Mui Van Zandt  
VP/Global Head, Data Strategy, Access, and Enablement  
GM, Inteliquet

# RWE begins with the ability to completely understand patients like never before

# Real World Evidence – Solution Map

*Helping to generate the evidence you need*

## Applied Real-World Solutions

- RWE planning
- Data landscaping and sourcing
- Scientific value statements development
- RWE in clinical development
- RWE portal

## Site-based Research

- Prospective observational studies
- Registries
- Patient reported outcomes
- Quality of life
- Enriched / Hybrid studies
- Comparative effectiveness
- Safety, surveillance, & regulatory studies

## Secondary Research

- Clinical and economic value proposition
- Impact of out-of-pocket costs and utilization management
- Treatment patterns
- Natural history of disease
- Disease prevalence
- Burden of illness, unmet medical need
- Comparative effectiveness

## Health Economic Modeling

- Health economic evaluations
- Global models and local adaptations
- Stakeholder-friendly presentations of models
- Budget impact models
- Indirect comparisons
- ICER/HTA submission
- Quality Measurement, QOL

# Regulators are increasingly interested in how RWE may support regulatory decision-making

## Despite challenges, traditional RCTs are the gold standard for drug evidence development

- Increasingly time and resource intensive to conduct
- Not broadly representative of the patients seen in actual clinical care
- May be unethical or infeasible to perform given small patient population sizes

## RWD/RWE can be used to demonstrate medical product safety and effectiveness

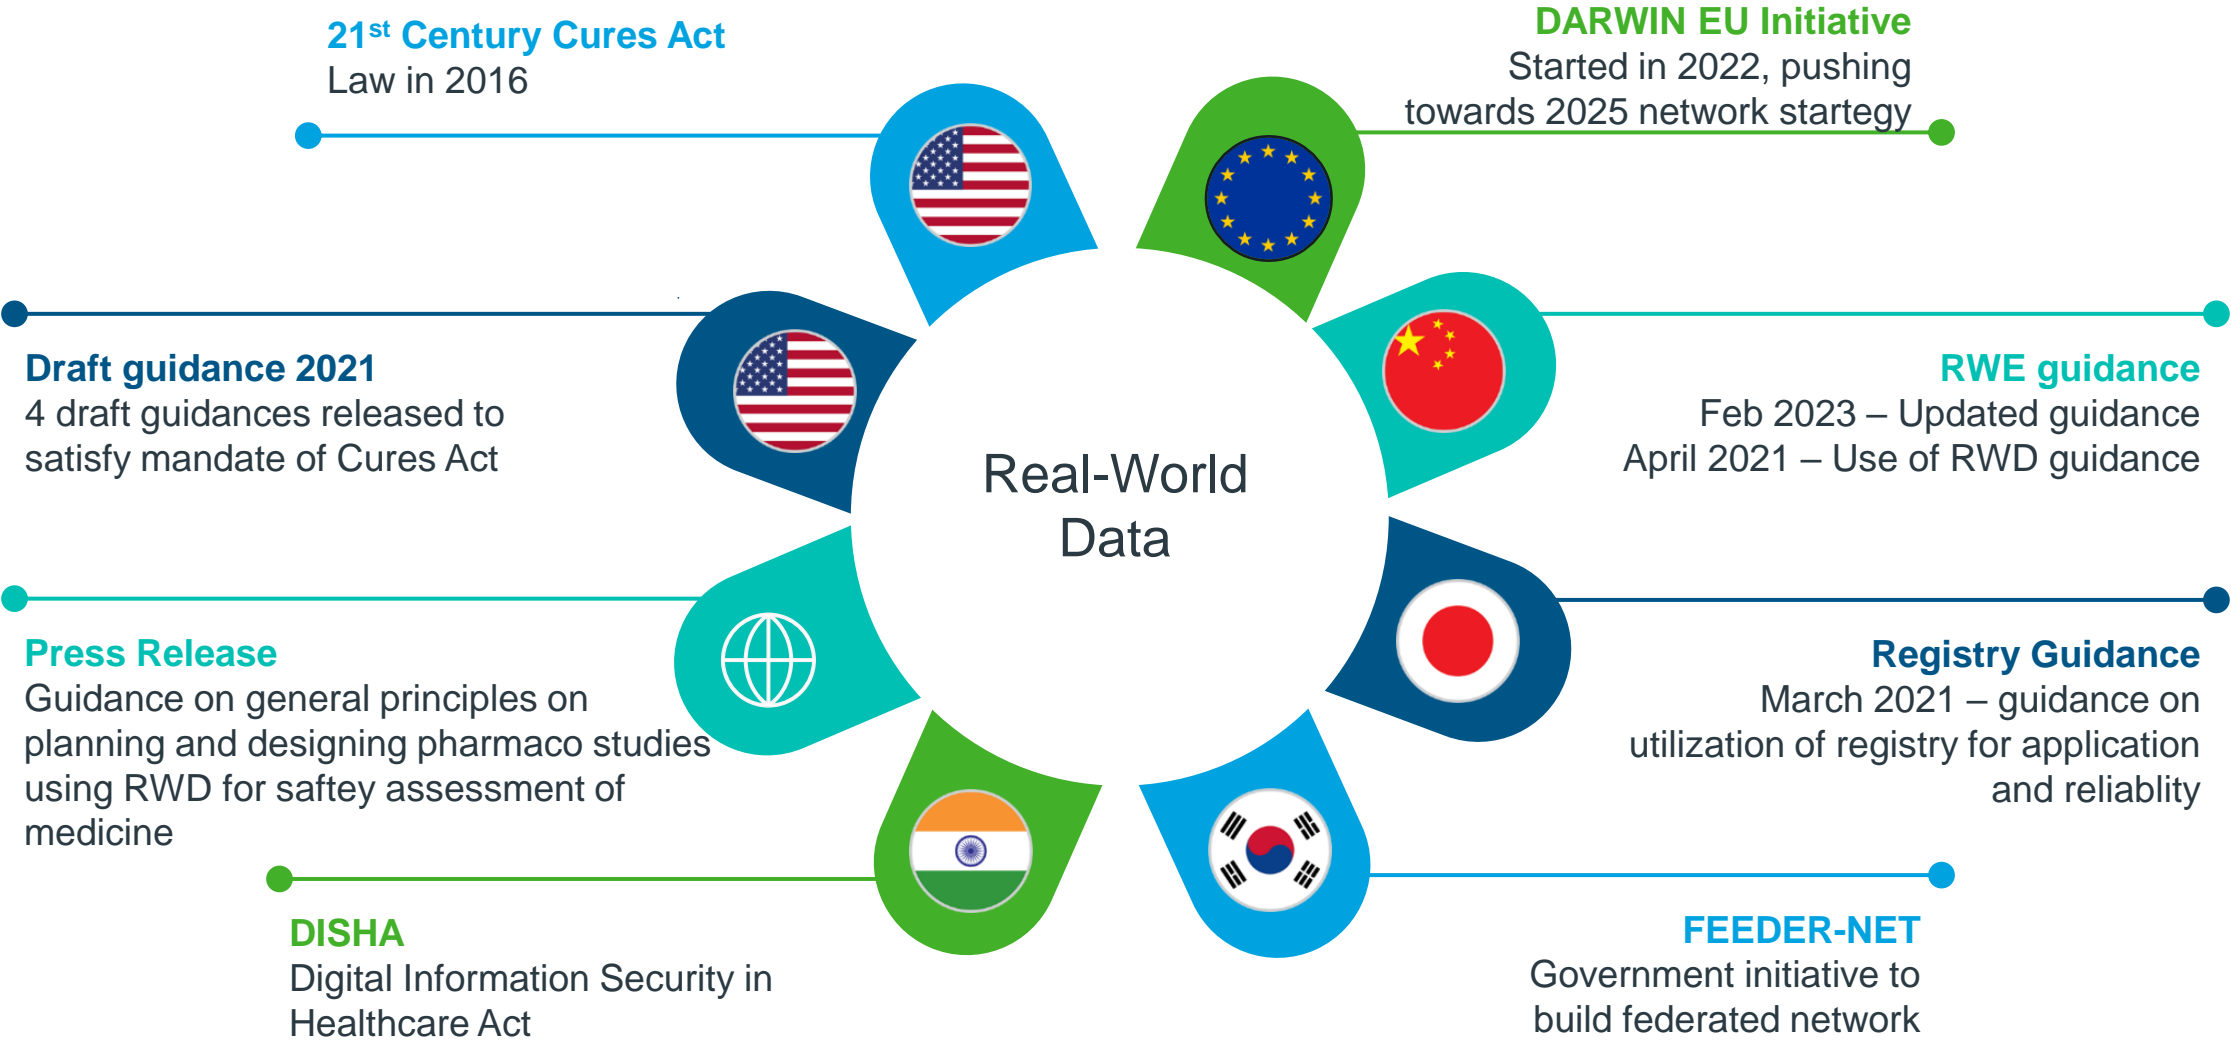

- RWE reflects broader patient populations
- RCTs may not be generating evidence on endpoints that are truly useful to patients, providers, or payers
- RWE can fill remaining downstream evidence gaps

## RWD/RWE can be used to improve the efficiency of clinical research

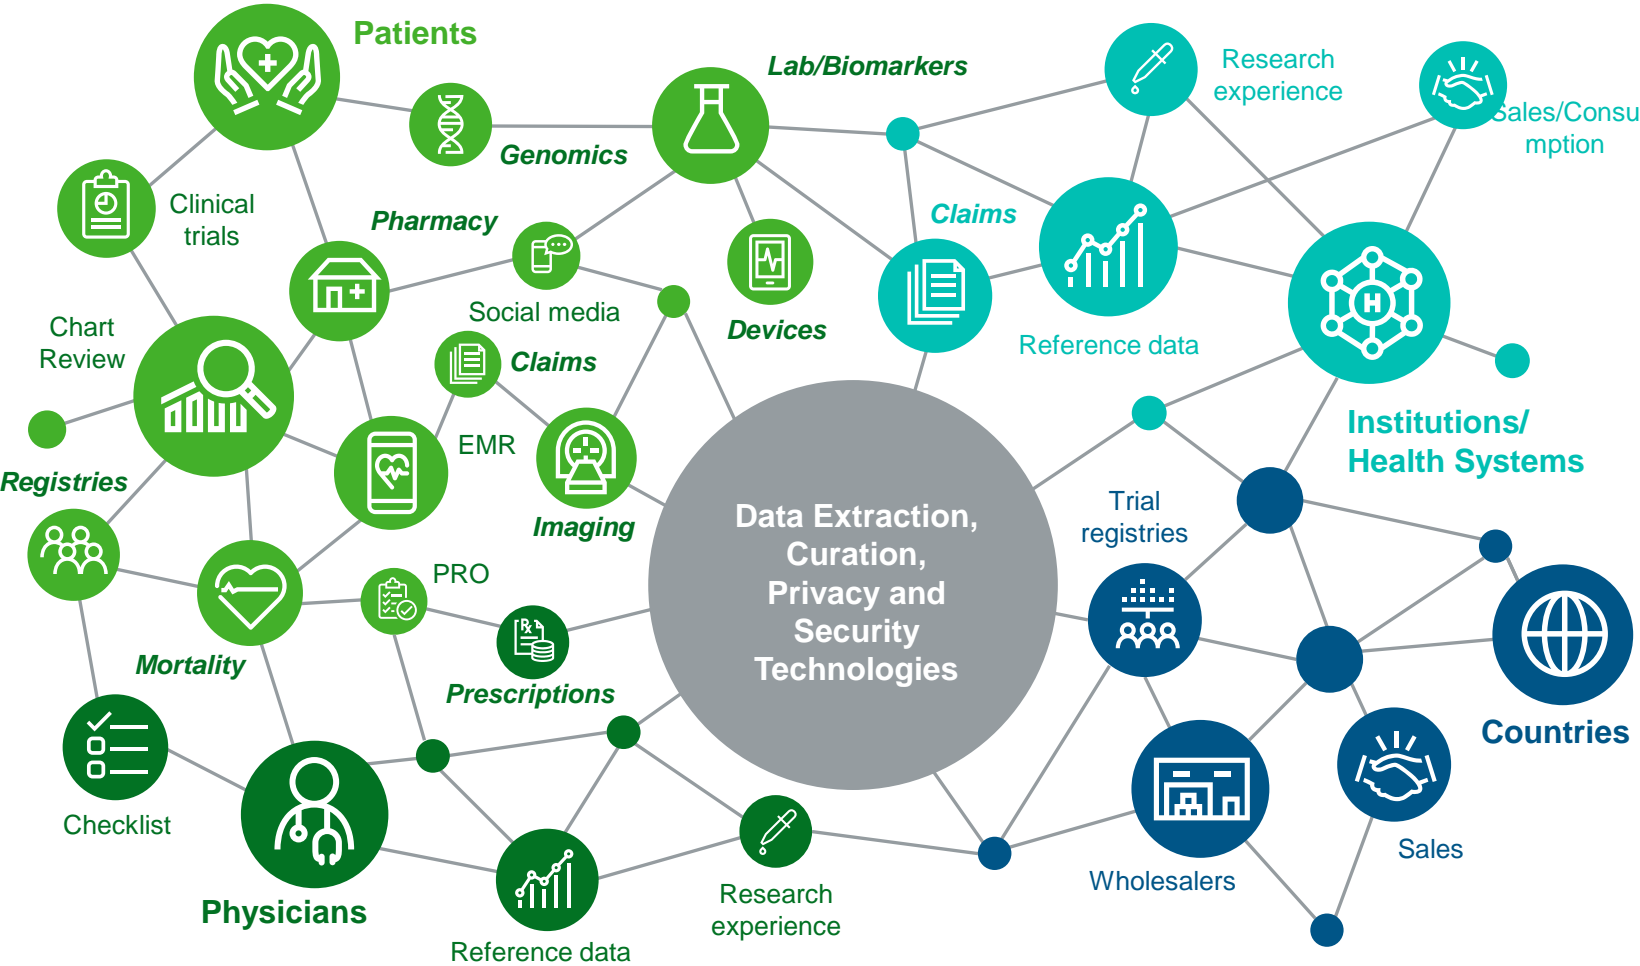

- Growing base of RWD from electronic health information infrastructure has enabled routine and increasingly robust collection of digital data at the point of patient care

# Regulators are increasingly interested in how RWE may support regulatory decision-making

# Increased demand for data standardization and data quality

Motivated by vast sources of RWD, and the need to integrate and analyze quickly for key insights

**Key insights**

- Cohort Identification
- Clinical Characteristics
- Translational Research
- Prevalence & Incidence
- Drug Safety & Efficacy
- Comparative Effectiveness

# Data standardization and harmonization through OHDSI

## What OHDSI is

- Open Source
- Community
- Data

## Why Choose OHDSI/OMOP

- **Fast, reliable** studies across a series of datasets and data types
- **Reduced cost of ownership** including understanding coding schemes, writing statistical programs across databases or developing software
- **Expanded data access** via the OHDSI network and remote multi-center database studies

<https://ohdsi.org/>

## OHDSI Collaborators

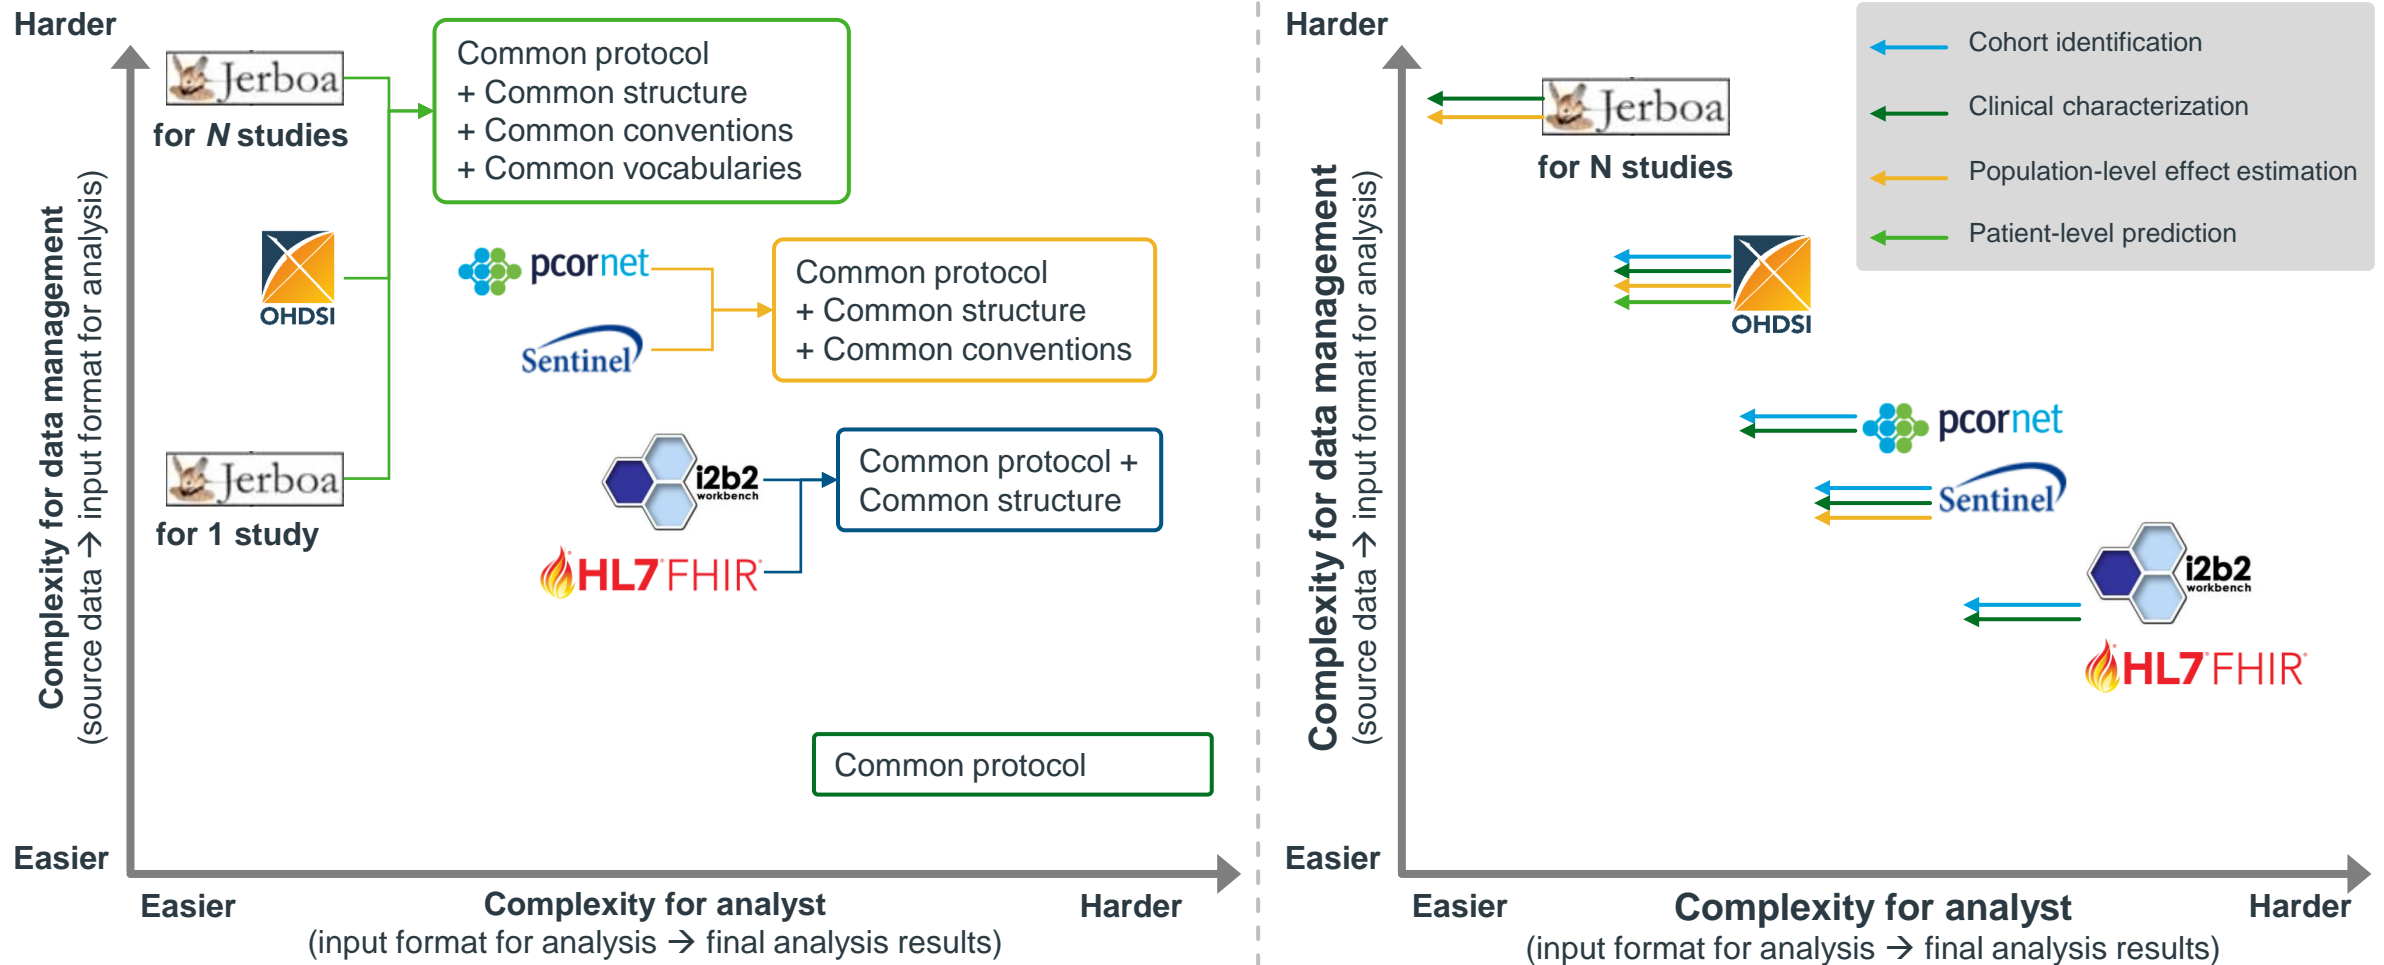

- 3,758 collaborators
- >1,100 organizations
- 83 countries from 6 continents

## OHDSI Network

- 534 data sources
- 49 countries
- 956M unique patient records

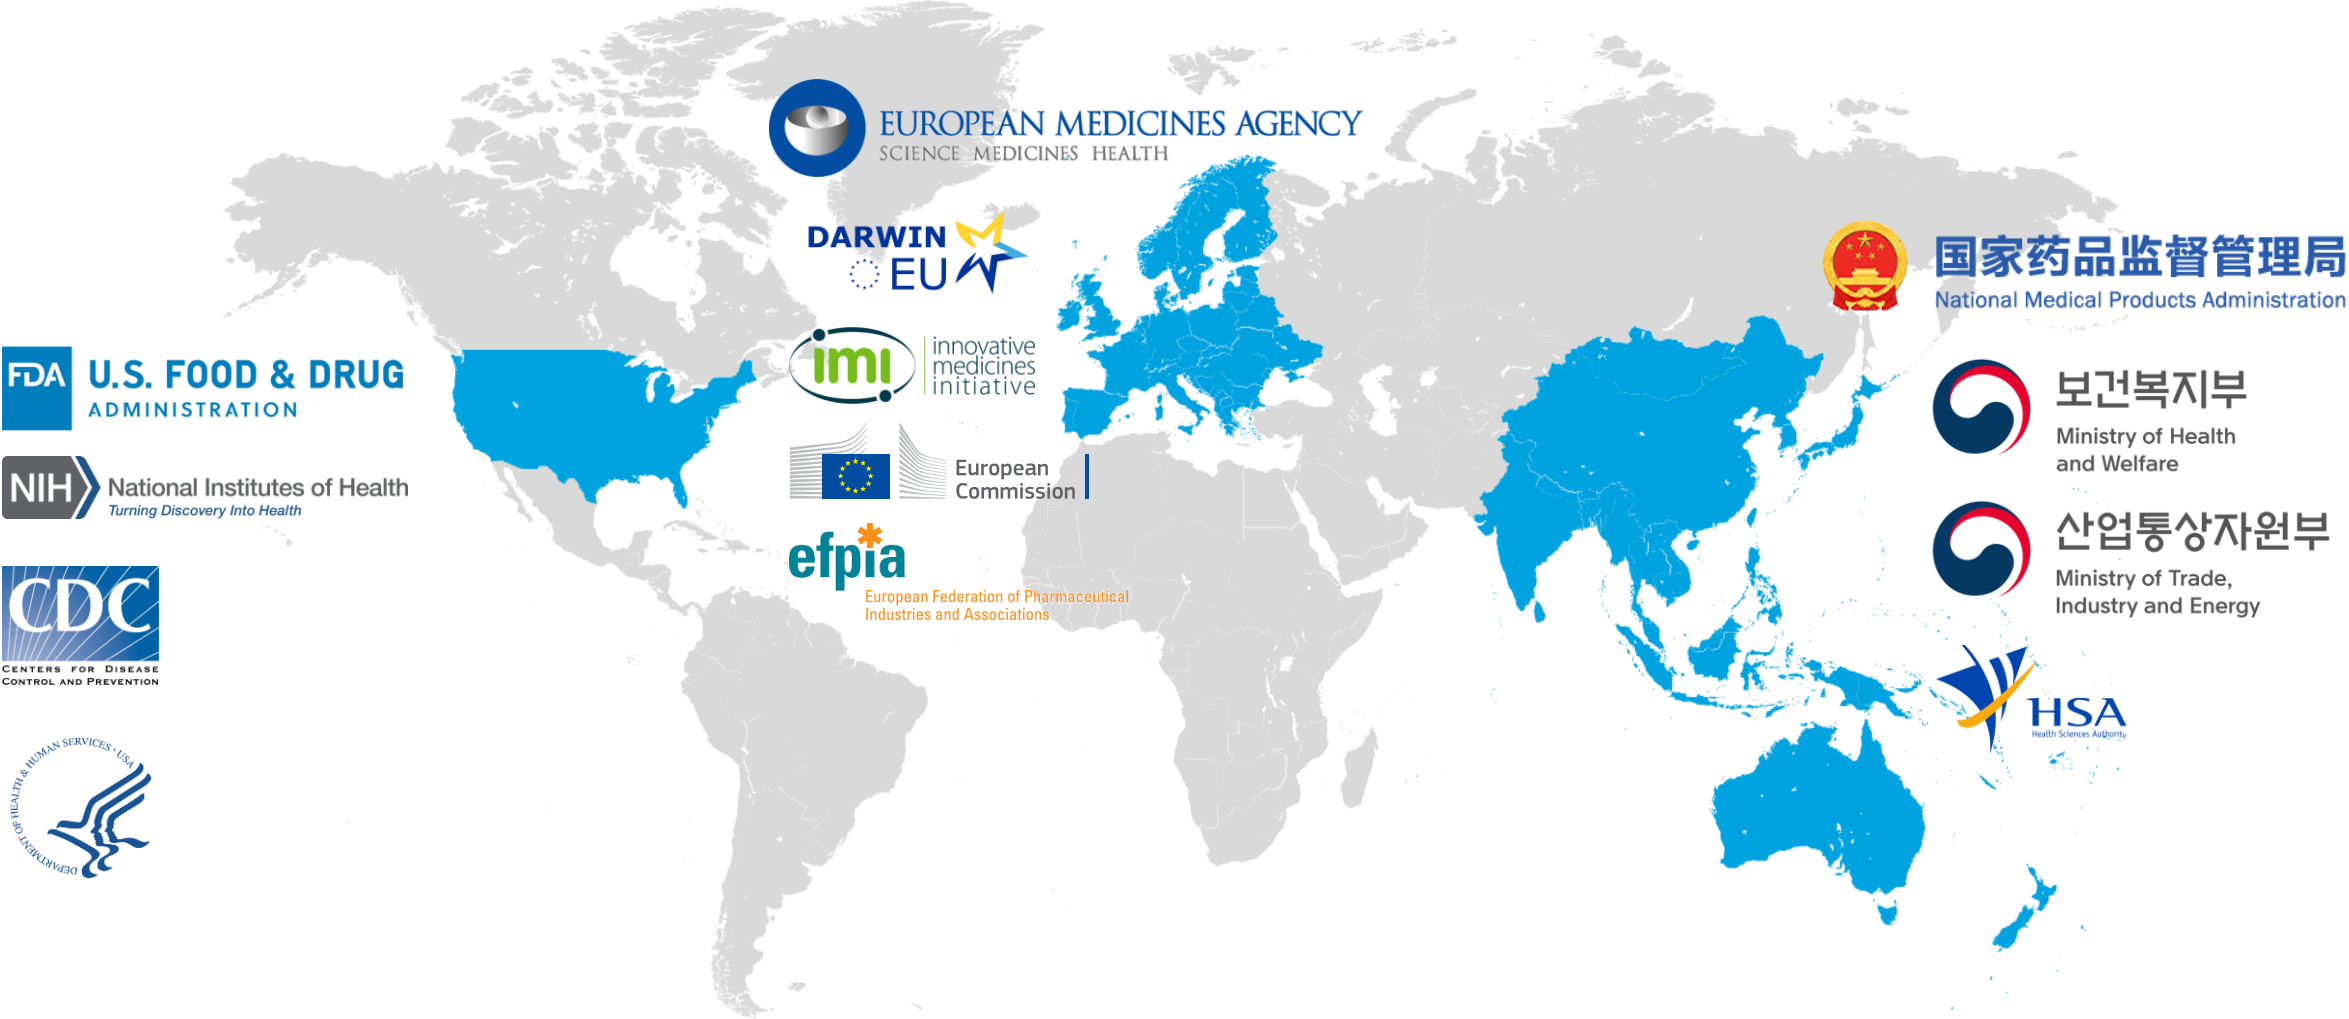

# Comparison of common data models

*Balancing trade-offs in data management vs. analysis complexity*

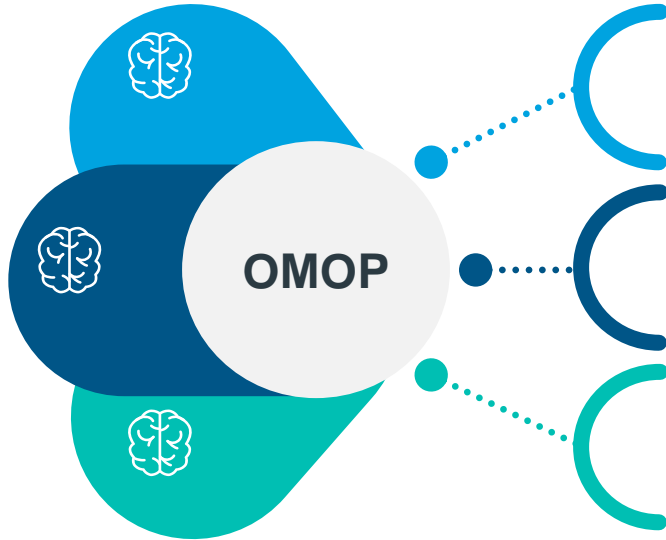

# Global Government Adoption of OHDSI/OMOP

# Collaboration across standards

OHDSI/FHIR

## OMOP CDM

- Dual source platform that supports both data science and application deployment
- Use of study results as actionable data to drive treatment decisions

## Improved Data Quality

Leveraging the OMOP standard data models and data elements defined in FHIR ensures consistent and accurate data capture, which improves the validity and reliability of observational studies.

## Real-time Analysis

Real-time analysis of FHIR-compliant data, which can be useful for real-world evidence generation and other applications.

Home > HL7 International and OHDSI Announce Collaboration to Provide Single Common Data Model for Sharing Information in Clinical Care and Observational Research

## HL7 International and OHDSI Announce Collaboration to Provide Single Common Data Model for Sharing Information in Clinical Care and Observational Research

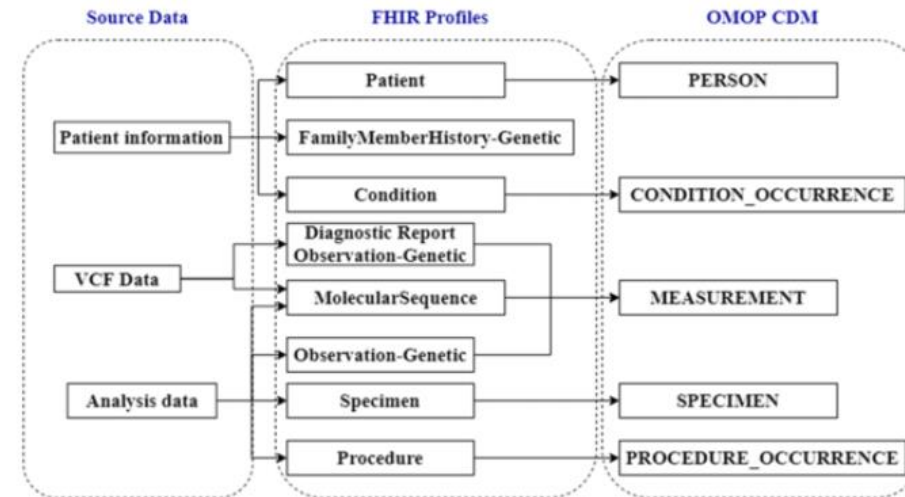

Health Level Seven International (HL7®) and the Observational Health Data Sciences and Informatics (OHDSI) network today announced a collaboration to address the sharing and tracking of data in the healthcare and research industries by creating a single common data model. The organizations will integrate HL7 Fast Healthcare Interoperability Resources (FHIR®) and OHDSI's Observational Medical Outcomes Partnership (OMOP) common data model to achieve this goal.

"We are excited to have the OHDSI community join this partnership with HL7 to evolve community standards around observational research and clinical care. These standards set the foundation for our mission of global, open-science research, and this partnership will accelerate the development of effective and safe treatments for diseases facing today's global population." - George Hirpscak

**OHDSI**

HL7 International CEO Dr. Charles Jaffe, M.D., Ph.D., underscored the significance of this partnership. "The Covid-19 pandemic has emphasized the need to share global health and research data." He continued, "Collaboration with OHDSI is critical to solving this challenge and will help our mutual vision of a world in which everyone can securely access and use the right data when and where they need it."

# FDA Best Federated Data Network Overview

Premier, multi-center research collaborative driving large scale health analytics research

# FDA BEST: COVID-19 Vaccine Safety Studies

## Key outcomes and communication

### Vascular outcomes (RCA)<sup>1</sup>

- Four potential AESIs detected
- Adults 65 years and older
- Post-vaccination with Pfizer-BioNTech COVID-19 vaccines
- FDA safety communication – **Jul 2021**

### Myocarditis/Pericarditis<sup>2</sup>

- Potential signal in young, male adults
- Post-vaccination with mRNA COVID-19 vaccines
- Study completion – **Dec 2021**

### RCA in adolescents and adults aged 12-64 years<sup>3</sup>

- 17 outcomes monitored in 3 databases
- Myocarditis/pericarditis signaled in 2 of 3 databases
- Anaphylaxis signaled in all databases
- Study completion – **Apr 2022**

### Initial Results of Near Real-Time Safety Monitoring of COVID-19 Vaccines in Persons Aged 65 Years and Older

Share Tweet LinkedIn Email Print

July 12, 2021

FDA has released information about the initial results of near real-time safety monitoring of COVID-19 vaccines in persons aged 65 years and older. These vaccines include Pfizer-BioNTech COVID-19 vaccine (Comirnaty) and Moderna COVID-19 vaccine (Spikevax). Four potential adverse events (AESIs) were detected in persons aged 65 years and older: myocarditis/pericarditis, anaphylaxis, Guillain-Barré syndrome, and thrombocytopenia with thrombotic thrombocytopenic syndrome (TTPS).

### Risk of myocarditis and pericarditis after the COVID-19 mRNA vaccination in the USA: a cohort study in claims databases

Hui-Lee Wong<sup>a</sup>, Mao Hu<sup>a</sup>, Cindy Ke Zhou, Patricia C Lloyd, Kandace L Amend, Daniel C Beachler, Alex Secora, Cheryl N McMahill-Walraven, Yun Lu, Yue Wu, Rachel P Ogilvie, Christian Reich, Djeneba Audrey Djibo, Zhiruo Wan, John D Seeger, Sandia Akhtar, Yixin Jiao, Yoganand Chillarige, Rose Do, John Hornberger, Joyce Obidi, Richard Forshee, Azadeh Shoaibi, Steven A Anderson

**Summary**  
**Background** Several passive surveillance systems reported increased risks of myocarditis or pericarditis, or both, after COVID-19 mRNA vaccination, especially in young men. We used active surveillance from large health-care databases to quantify and enable the direct comparison of the risk of myocarditis or pericarditis, or both, after mRNA-1273 (Moderna) and BNT162b2 (Pfizer-BioNTech) mRNA COVID-19 vaccines.

**Methods** We conducted a cohort study using claims data from three large health-care databases (Optum, HealthCare, and IQVIA) to evaluate the risk of myocarditis or pericarditis, or both, after mRNA-1273 and BNT162b2 mRNA COVID-19 vaccination in persons aged 12 to 64 years.

**Results** Myocarditis or pericarditis, or both, were diagnosed in 17 persons after mRNA-1273 vaccination and in 17 persons after BNT162b2 vaccination. The risk of myocarditis or pericarditis, or both, after mRNA-1273 vaccination was significantly higher than after BNT162b2 vaccination in persons aged 12 to 64 years (odds ratio 1.8, 95% CI 1.1 to 3.0).

**Conclusions** Myocarditis or pericarditis, or both, were diagnosed in persons aged 12 to 64 years after mRNA-1273 and BNT162b2 mRNA COVID-19 vaccination. The risk of myocarditis or pericarditis, or both, after mRNA-1273 vaccination was significantly higher than after BNT162b2 vaccination in persons aged 12 to 64 years.

**Keywords** COVID-19; mRNA-1273; BNT162b2; myocarditis; pericarditis; COVID-19 mRNA vaccination.

**Introduction** Myocarditis or pericarditis, or both, are rare but potentially serious conditions that can occur after COVID-19 mRNA vaccination. Several passive surveillance systems reported increased risks of myocarditis or pericarditis, or both, after mRNA-1273 and BNT162b2 mRNA COVID-19 vaccination, especially in young men. We used active surveillance from large health-care databases to quantify and enable the direct comparison of the risk of myocarditis or pericarditis, or both, after mRNA-1273 and BNT162b2 mRNA COVID-19 vaccination in persons aged 12 to 64 years.

# Key takeaways

*Thank you for your attendance*

01

Regulatory entities are becoming more interested in the use of real-world data not only for surveillance and safety, but for drug development and clinical research

02

OHDSI is an open-source community with data standardization and vocabulary harmonization

03

Standardized analytics allows for transparency and gaining of trust

04

OHDSI is a globally accepted methodology and continues to expand in the APAC region
